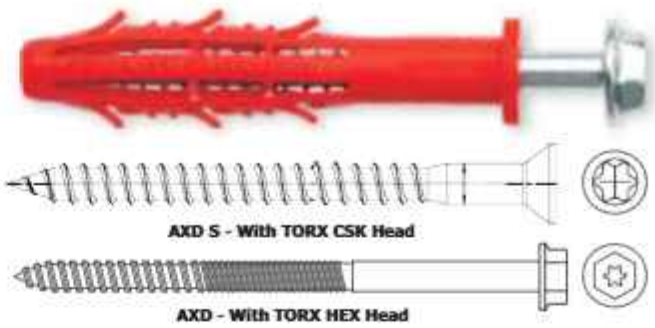
AXD — NYLON FRAME ANCHOR FASTENER

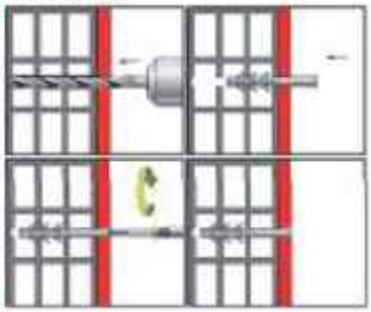
AXD

EUROPEAN TECHNICAL INSTITUTE APPROVED



The AXD Nylon Frame Anchor Fastener has a 4-way expansion area and is suitable for through - fixing into bricks, concrete, etc. The special internal design of 4-way expansion and pure nylon polyamide plug provides a firm and secure fixing into concrete, stone and softer materials such as bricks and low density block work.

INSTALLATION:



APPLICATION

- Hollow Brick
- Brick
- Concrete
- Stone
- Auto Aerated Concrete

MATERIAL

PLUG
Polyamide PA6.6 (Nylon)

Screw
- Carbon Steel Grade 8.8
- SS 304
- SS 316

ADVANTAGES

- Strong Anchoring
- High Temperature Resistance
- 4-way Expansion

TECHNICAL DATA :

AXD – LOAD PERFORMANCE DATA

Recommended Load (For Single Anchor)

Type of anchor	Screw size [mm]	Base material	Embedment Depth h_{nom} [mm]	Tensile Strength N_{rec} [kN]
AXD ø8	4.8	Concrete C20/25 ÷ C50/60	40	1.32
		Clay bricks MZ class 20	40	0.4
		Calcium silicate bricks KS class 20	40	0.34
		Calcium silicate hollow blocks SILKA class 15	40	0.3
		Vertically perforated clay bricks class 15	40	0.21
		Autoclaved concrete blocks PP6 600/4	40	0.4
AXD ø10	6.8	Concrete C20/25 ÷ C50/60	58	2.4
		Clay bricks MZ class 20	58	1.7
		Calcium silicate bricks KS class 20	58	1.65
		Calcium silicate hollow blocks SILKA class 15	58	0.8
		Vertically perforated clay bricks class 15	58	0.48
		Autoclaved concrete blocks PP6 600/4	58	1.12

Note: Recommended loads are derived by applying a safety factor of γ=2.5 on the characteristic resistance.
Recommended loads in kN (1kN ≅ 100kg)

100% PURE NYLON POLYAMIDE

4 - WAY EXPANSION

ARROW THROUGH BOLT WEDGE ANCHOR (ATBWA)

MATERIAL:
M.S, S.S.304 & S.S.316
SUTABLE FOR NON CRACKED CONCRETE & CRACKED CONCRETE

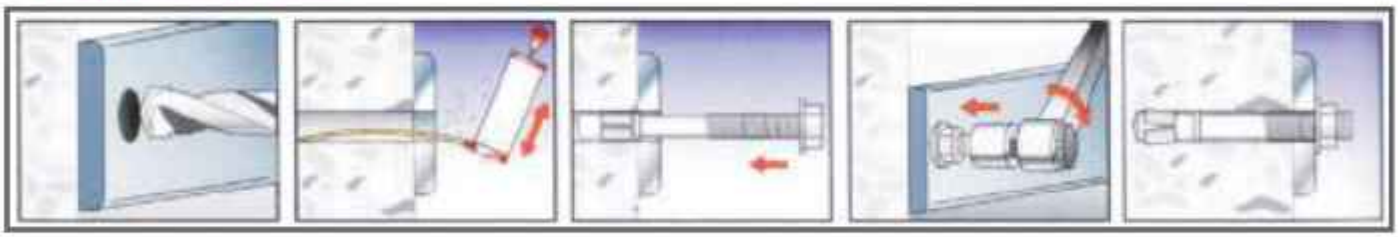
APPLICATION
1) Lifts & Car Parking Systems
2) Facade & Cladding Work
3) Heavy Duty Structure
4) Railings
5) Piping
6) Plant Engineering
7) Support Plates Fixing etc.

Characteristics:-
- High performances through steel anchor composed of steel pin, nut, washer and expansion clip.
- When the hexagonal nut is tightened, the tapered bolt is pulled into the expansion clip and expands it against the drill hole wall
- Reduced hole diameter
- Suitable for through-setting applications in concrete
- Thread diameter and hole diameter are the same
- Reinforced anchor's head to avoid damaging the thread during the installation
- Special designed expansion clip granting a smooth expansion and avoiding the rotation of the anchor during the installation

Installation:
- Through-setting anchor

Suggestion for use:
- Choose the right size of the anchor according to the load.
- Always check load bearing capacity values in the table.
- Respect the installation data.
- Clean the hole before the installation.

Installation Method



Application

ARROW THROUGH BOLT WEDGE ANCHOR (ATBWA)
Material ? Mild Steel, GI Plated (as per IS 1367) ? SS 304 ? SS 316

LOAD DATA

ATBWA Mild Steel, GI Plated (as per IS 1367)

All values in this section are based on the following conditions:

? Correct anchor installation (refer to setting instructions)
? No influence from edge distance or anchor spacing
? Minimum concrete member thickness is maintained
? Concrete grade: C25/30- Uncracked concrete substrate
? Dry indoor conditions (unless specified for stainless steel)

ARROW SLEEVE ANCHOR (ASLE)

08
ASLE

SUITABLE FOR :-
NON-CRACKED CONCRETE
NATURAL STONE
SOLID BRICK
TORQUE CONTROLLED EXPANSION

Material.
Carbon steel
Galvanized to min 5 microns.

Application
1) Cable trays
2) Plates
3) False ceiling
4) Railings
5) Plant engineering
6) Stairs
7) Signs
8) Satellites dishes

ARROW Zinc plated Hex with Flange Concrete Screw Anchor

Self-tapping concrete screwbolt

Product information

Features and benefits

- Time-efficient through-fixing installation with streamlined procedure - simply drill and drive.
- Completely removable with possibility of reuse
- Unique design with patented threadform ensures high performance for relatively small hole diameter
- Non-expansion functioning ensures low risk of damage to base material and makes R-LX ideal for installation near edges and adjacent anchors
- High performance in both uncracked and cracked concrete
- Different head types for any application
- Oversize head for fixtures with elongated holes
- Excellent product for temporary fixing
- Suitable for standard and reduced embedment depth

Applications

- Through-fixing
- Temporary anchorages
- Formwork support systems
- Balustrading & handrails
- Fencing & gates manufacturing and installation
- Racking systems
- Public seating
- Scaffolding

Base materials

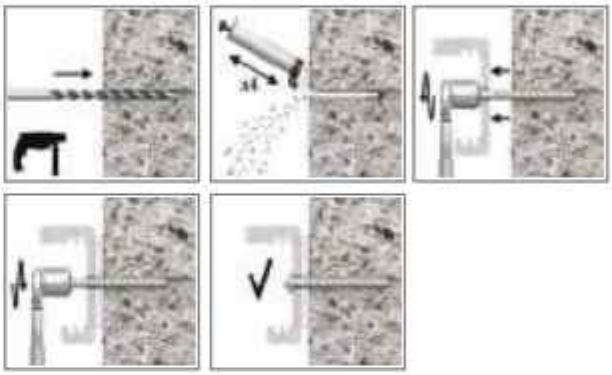
Approved for use in:

- Cracked concrete C20/25-C50/60
- Non-cracked concrete C20/25-C50/60
- Reinforced concrete
- Unreinforced concrete

Also suitable for use in:

- Natural Stone (after site testing)

Installation guide



1. Drill the hole with rotary hammer drilling machine. Drill to a required depth.
2. Blow out dust at least 4 times with a hand pump.
3. Possibility of unscrewing and re-screwing.
4. Tighten to the recommended torque.
5. After installation.

Basic performance data

Highlights 2018
R-KER II

"STRENGTH AND SAFETY OF FIXING

ETA · CE · EARTHQUAKE · C1 - C5 · ZP ZINC-PLATED · ZF ZINC FLAKE COATING · UNSZF · HDG HOT DIP GALVANISED STEEL · HCR HIGH CORROSION RESISTANCE · A2 STAINLESS STEEL · A4 STAINLESS STEEL

Hybrid bonded anchor
R-KER II

Efficiency and comfort of use, high technical parameters confirmed by recognised certificates and a wide range of applications with different rod types guarantee durable and secure anchoring. It is the needs of our clients that inspired us to develop the R-KER II.

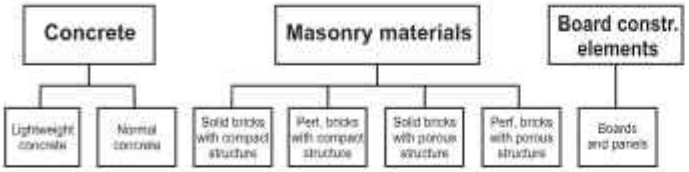
Basic principals of fixing and anchor technology

1. Building material (Anchor base)

Classification of the most common building materials



1.1 Concrete

- **Lightweight concrete**
- **Normal concrete**
- **Compressed concrete**

e.g. B25= compressive strength of 25 N/mm² (concrete)
Lb10= compressive strength of 10N/mm² (lightweight) concrete)

▸ The higher the compressive strengths the higher the load. bearing capacity of the anchor.

2. Installation advice

2.1 Drilling methods according to the building material

- **Percussion drilling** with carbide drills
  Drilling at high speed with fast, short actions. Application: brickwork made of solid blocks.

- **Hammer drilling** with SDS-drills:
  Drilling at low speed with slow, strong actions. Application: concrete and natural stone.

2.2 Drilling-hole depth

- Larger than the anchorage depth of the fixing
  = sufficient space for dill dust and tip of the screw

2.3 Drill-hole cleaning

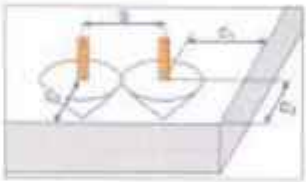
- Remove drill dust
- A clean drill-hole increases the strength characteristics

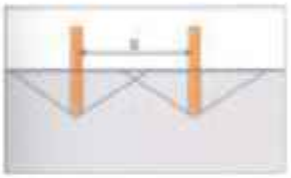
2.4 Anchorage depth/fixing thickness

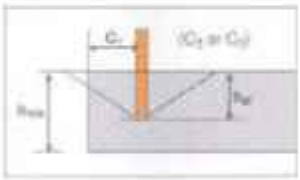
- Anchorage depth =h_v
  = distance between the upper edge of the load-bearing component and the end of the fixing
- Fixing thickness (through fixing) = t_{fix}
  = thickness of component to be attached

2.5 Edge and axial spacing

Compliance with edge and axial spacing prevents splitting or formation of cracks in the substrate.







Taking into account the stress values created by the expansion of anchors and the loads they are designed to support, the following points must be respected when establishing the performance of each individual product (recommended load):

☒ the minimum thickness of the base material (detemined by anchor depth h_{ef})

☒ the minimum distance between anchors (S)

☒ the distance of anchors from edges of the slab or structure (C_1, C_2) and corners (C_3)

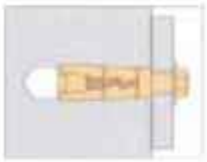
The coincidence of stress cones of adjacent anchor in concrete reduces their tensile performance.

☒ Anchor depth : h_{ef}

Each anchor has a minimum anchorage depth which guarantees its safe working load.

2.6 Installation methods

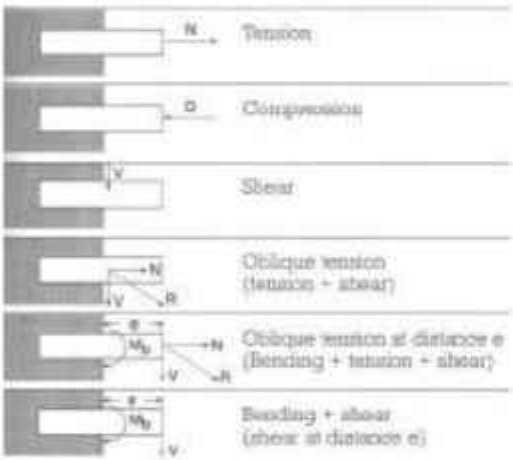
- **Flush fixing**
  - → Drill hole
  - → Install fixing flush with the surface
  - → Driver screw through the component to be attached and into the fixing



- **Trough fixing**
  - → Drill hole
  - → Insert fixing through the component to be attached and into the drill-hole, and expand

3. Loads

3.1 Types of load



3.2 Ultimate loads - safety coeffi cients - permissible loads

We distinguish between different types of loads :

- **Ultimate load** (mean value from at least 5 individual tests in uncracked building material). Failure criteria may be : splitting of the anchor base material, the fixing being pulled out, failure of the base material itself or steel failure.
- **Characteristic ultimate load** (5% fractile, i.e. where 95% of all ultimate loads are either reached or exceeded).
- **Permissible loads.** These are working loads, which already contain an appropriate safety coefficient.
- **Recommended loads.** These are working loads, which already contain an appropriate safety factor.

To determine the maximum recommended load the ultimate load is divided by a safety coefficient, e.g. for a steel fixing of 100kN breaking force:

$$\text{Max. recommended load} = \frac{\text{Ultimate load (F)}}{\text{Safety coefficient } (\gamma)}$$

$$\text{F work} = \frac{100\text{kN}}{4} = 25 \text{ kN } (1\text{kN} \simeq 100\text{kp})$$

As a safety factor we recommend :

a) in relation to ultimate load mean value : Steel anchor $\gamma \geq 4$

4. Load transfer mechanism (function)

examples from the arrow ranges of products

- **Mechanical interlock (friction)**

The expanding part of the fixing in pressed against the drill-hole wall.

Expansion achieved by application of torque.

- **Bonding (stress-free)**

Resin Capsule & Chemical Anchor

The anchor consists of a fixing elemant (male or female stud) and a synthetic - based mortar. Manufactured from 2 components, hardener and resin which when mixed together, which hardens to create the fixing by bonding to the base material.

Adhesive anchor do not generate stress in the building material.

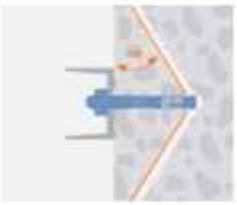
5. Modes of failure

Excessive loads, incorrect installation and a poor substrates can all lead to the failure of fixing systems.

Mode of failure **Cause**

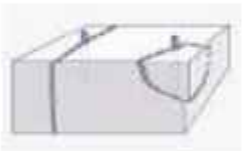
Failure of the anchorage substrate

- load "N" too high
- anchorage substrate not strong enough
- anchorage depth insufficient



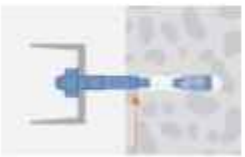
Splitting of the base material

- component dimentions too small
- edge-and axial spacing not observed
- expansion force to high



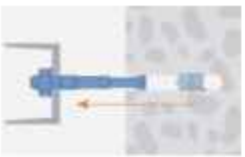
Pull-out of the fixing

- bond interlock fails due to excessive load or incorrect installation



Steel failure

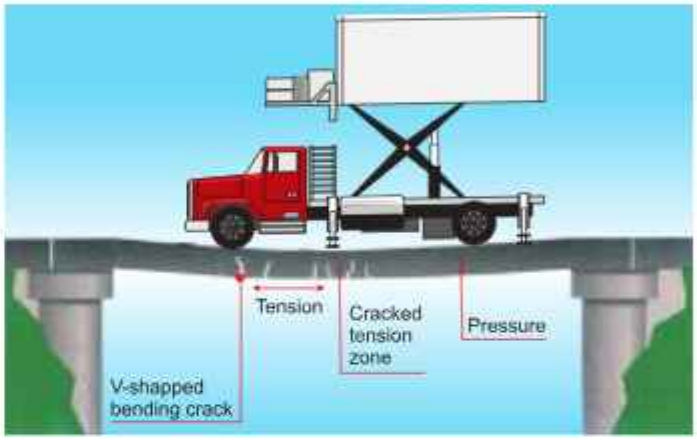
- steel component part insufficient strength for the required load



6. Cracks in concrete

6.1 Reasons for cracks caused by :

- Shrinkage and Loading of the concrete
- External influence such as earthquakes
- Inherent weight, traffic and wind loads, fluctuating temperatures
- Tension, deformation



- Concrete cannot expand
- This leads to the formation of countless, barely visible cracks **(= cracked tensile zone)**
- Cracks can also develop in buildings which have been in use for many years

6. 2 Steel anchors suitable for cracks

- Anchors which automatically continue to expand, where a crack occurs (=post-expansion), e.g. Arrow (ATBWA)

ARROW

ANCHOR FASTENER

FOR ARCHITECT INTERIOR DECORATORS AND FALSE CEILING CONTRACTORS

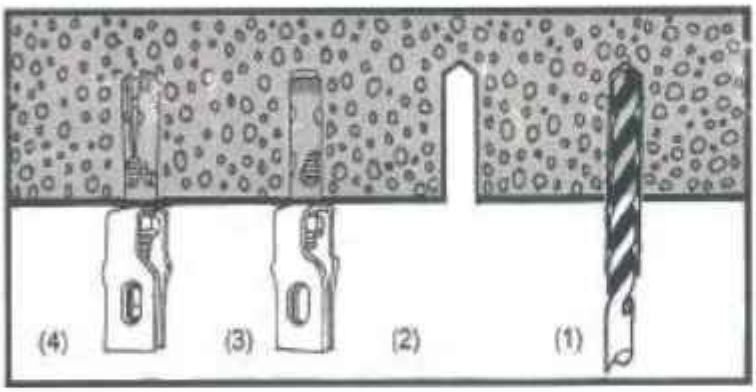
SPECIAL FEATURES

(1) The only single piece sleeve anchor with assembled hanger, taper bolt and nut, which has smaller drill dia, hence, low & economical drilling cost, Example 5 mm Fastener with 1/4" or 8 mm drill dia & 40 mm deep and having a safe load of 200 kgs in 30 N/mm² concrete.

(2) Economically priced to suit all budgets.

(3) Most suitable for false ceilings as well as light fixture hanging.

(4) Material mild steel (Zinc Plated).



FIXING METHOD

(1) Drill a hole of 1/4" or 8dia / 40 mm deep in the ceiling.

(2) Remove the dust with brush

(3) Insert the full assembly with sleeve in concrete and hanger projecting out as shown in the figure

(4) Now tighten the sleeve anchor by rotating the hanger with the spanner. In 3 to 5 turns the sleeve will slip on the taper bolt as the sleeve is provided with slits it will expand on tightening and take the grip

THE NEW GENERATION FALSE CEILING FASTENERS HAS ARRIVED

ARROW ENTERPRISES
